mobiDEOS Launches

WebView Surveillance Platform

Fixed surveillance and remote monitoring solution offers 'anywhere, anytime' access for professional security applications

Video surveillance and remote monitoring company **mobiDEOS, Inc.** announces the availability of **WebView**, the professional security industry's first truly open web-based platform for fixed surveillance.

Now shipping globally, **WebView** frees security professionals and other end users from the restraints of inflexible, proprietary systems. **WebView** users can connect to IP cameras, DVRs, NVRs and video servers from different vendors, and access all components from a single browser – eliminating the need for multiple interfaces and browsers to achieve the same task.

WebView users can quickly respond to security events, gather business intelligence and remotely monitor general activity at any location, from any location.

Interoperable with **MAC** systems in addition to **PCs**, **WebView** gives users true freedom in choice of browser. **WebView** users can configure the system within minutes, using **Internet Explorer**, **Mozilla**, **Chrome**, **Safari** and/or **Opera** browsers to establish connections with cameras and recorders. Setup time is further minimized with no software, plug-ins or active controls to install.

"**WebView** gives business owners, facility managers and other professionals 'anywhere, anytime' access to multiple devices over a single interface," said **Sri L. Palasamudram**, CEO of **mobiDEOS, Inc.** "With nothing to install, users have access to an open platform within minutes, freely able to view and control

cameras, **DVRs**, **NVRs** and video servers from any browser."

WebView was born from the success of **MobileCamViewer**, the award-winning **mobiDEOS** product that introduced flexible remote monitoring and surveillance over smartphones and other mobile devices. Future **WebView** releases will support interoperability with **MobileCamViewer**, allowing users of both products to synchronize **WebView** to smartphones and easily transfer information between systems.

WebView uses the same proven engine as **MobileCamViewer** for reliable service and connectivity. Logging in to the system is simple as accessing a **GMail** or **Facebook** account, allowing users to quickly launch surveillance and monitoring operations.

Like **MobileCamViewer**, systems integrators can use the **mobiDEOS Test-Monitor** solution to wirelessly test video source equipment connected to **WebView**, ensuring that camera positions are functioning correctly and covering the correct range of vision. Installers can also check an entire network of cameras from a single location, eliminating the

need to manually connect to every camera in the network with separate login information.

need to manually connect to every camera in the network with separate login information.

About **mobiDEOS, Inc**

mobiDEOS, Inc. provides compelling applications, technologies, and services to help users realize the value and potential of live video streaming on mobile devices and computers. Its products, including **MobileCamViewer** and **WebView**, offer secure, reliable carrier-grade remote monitoring and video surveillance solutions that provide instant business intelligence, and situational awareness and readiness for large private enterprises, educational institutions, government agencies, and public service employees among others. ■
